4 MAY 70

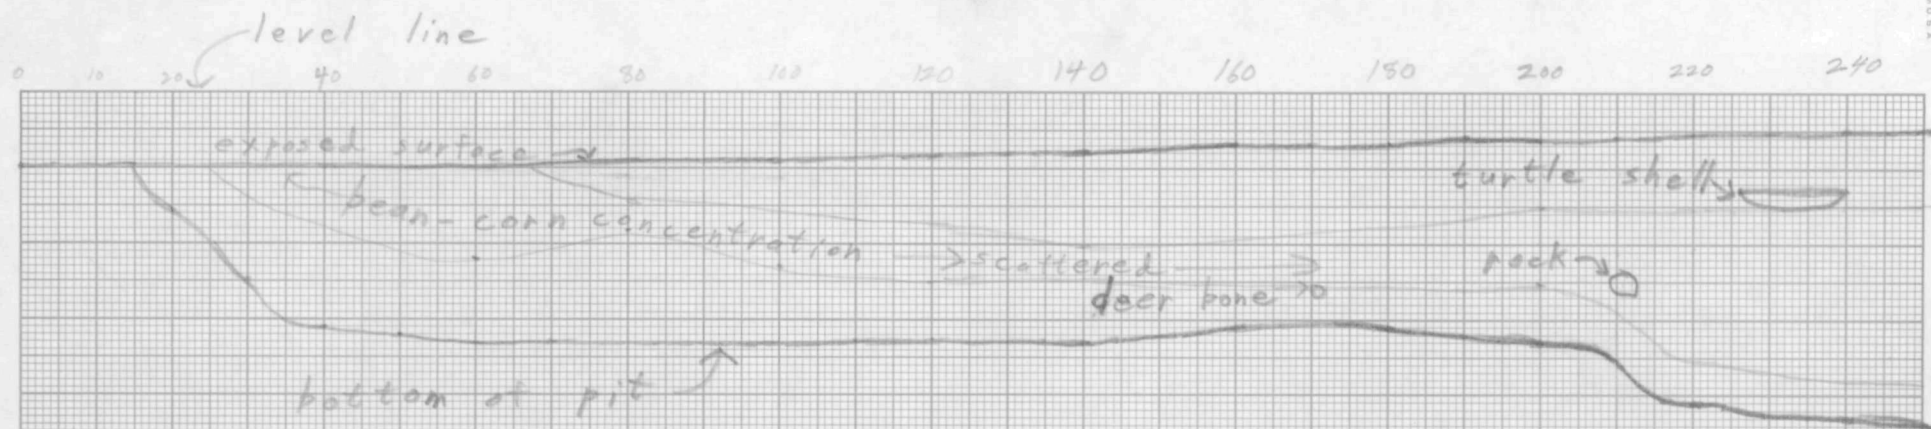

When the south half of the pit was completed several weeks ago, the large celt was photoed in situ, but the point had been moved when found - thought to lie ca. 1" W of celt, ca 1" above pit floor, and pointing N. as shown in photos.

Fea. 40 is a large, relatively complex pit discovered in ~~the~~ April but not excavated until June, 1970. Its excavation was neither complete nor particularly systematic. When first noticed its outline was not clear but it appeared to extend south of the trench so an attempt to follow it was made. After clearing a considerable area under the south backdirt pile, the limits of the pit were still not clear. Actually, at this time it was not clear if it was a pit, sheet midden, or other disturbance, although tests with the trowel suggested some depth. Further investigation was abandoned until June when final scraping of the trench floor (the last section of the trench to be scraped) revealed a fairly clear outline of an elongated pit. The west edge was the clearest. Further attempts to expose the entire pit resulted in an indefinite delimitation of the south end and a somewhat unclear east edge; the west edge was fairly clear. It was elected to cross section the pit by removing the east half. The nature and richness of the fill was quite variable, although artifacts were no where exceptionally abundant. Some difficulty was encountered in defining the north end: originally it was gently sloped, but later we decided it was fairly steep-walled. Near the north end was an area of mottled loose soil including a sloping layer of mostly fire-cracked rocks. In the same area was a deep hole filled with loose soil, an old rotted stump or a rodent hole. South and north of these disturbances the soil was more compact. Later, when the profile was cleaned and the rest of the pit removed, it became obvious that the loose soil was due to an intrusive burial (Fea. 45).

intrusive

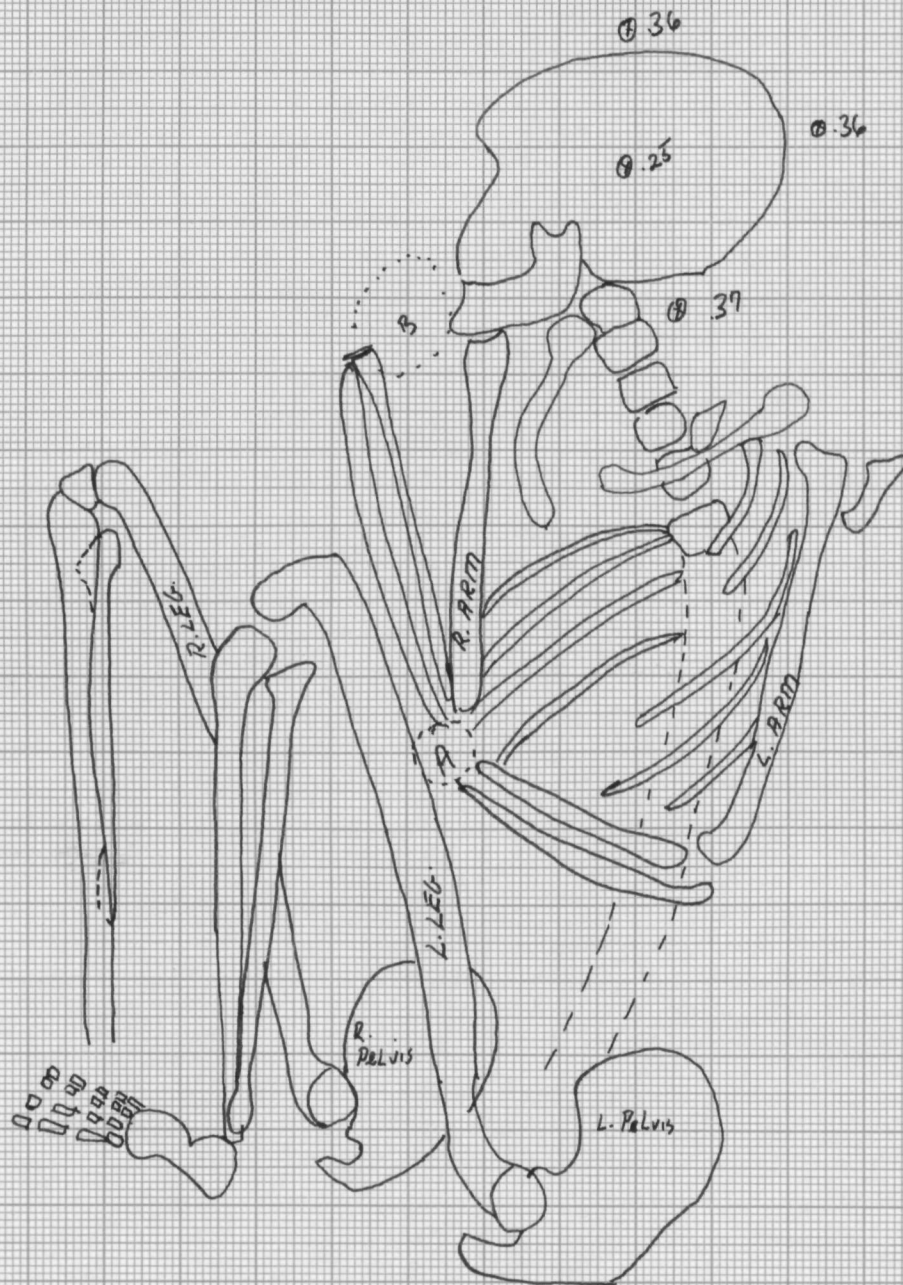

Toward the center of Fea. 40 a clear/pit outline was noticed after removing 8-10 cm. of fill (Fea. 41). In cross section it did not appear to extend to the top of Fea. 40 and was not visible in horizontal section until 8-10 cm. of the fill above it had been removed. However, one of the few, perhaps only small white quartz points found in Fea. 40 was directly above Fea. 41, so perhaps Fea. 41 extended higher than was apparent in the soil colors. The nature of its fill was, apart from color, similar to that of Fea. 40.

From about the south edge of our main trench toward the south the east wall of fea. 40 was never definitely determined and not completely excavated. Our excavation did reach the bottom of the feature along the exposed cross section profile, but the floor of our excavation was only 30-40 cm. wide. The south end of the pit was never found. Exploratory excavation after the profile was drawn indicated that it extended considerably beyond the point recorded in the profile.

The adult burial in Fea. 40, simply referred to in notes as Fea. 40 burial, may have been inclusive in the fill as no pit outline was apparent in cross sections or during excavation.

Excavation of the west half of the pit was begun, but not completed. All of Fea. 40 in the main trench area was dug--that area included Fea. 40 burial and Fea. 45. South of the trench, the east wall of the pit was not defined; the south end lower part of the west half was not removed; the south end of the pit was not located or dug. Provenience of fill removed from Fea. 40 was not carefully controlled and the the designations such as NE quad. indicate only generally that area in the main trench. However, there was control between east and west halves since after the profile was drawn the only additional work in the east half was removal of fea. 45. Also;
